Technical Comparison Between GET and POST

Feature	GET Method	POST Method
Primary Purpose	Retrieve data from the server	Submit or modify data on the server
Data Location	Appended to URL string (?key=value)	Carried inside the HTTP request body
Data Visibility	Visible in URL bar, history, and logs	Hidden from URL bar and browser address field
Payload Capacity	Restricted by URL limits (~2,048 chars)	Unrestricted (governed by server capacity)
Caching & History	Cached by default; saved in history	Never cached; excluded from browser history
Bookmarking	Fully bookmarkable with parameters	Cannot be bookmarked with input state
Idempotency	Idempotent: Multiple calls return same state	Non-idempotent: Re-calls create side effects
Page Refresh	Refreshes safely without warnings	Triggers "Confirm Form Resubmission" alert

Implementation Guidelines

- **When to Use GET:** Search & Filtering: Passing query parameters where shareable links are beneficial (e.g., /products?cat=shoes).
- **When to Use POST:** Sensitive Operations: Transmitting logins, passwords, or personal data to keep them out of server logs.
